

# Specialized Power for Orchard and Grove

**T**HE above illustration will give you an idea of the relative size of the O-4 and O-6 tractors. Compare these dimensions. The height of the O-4 at the radiator is  $53\frac{7}{8}$  inches and the wheelbase is  $66\frac{1}{2}$  inches. For the O-6 the figures are  $60\frac{5}{8}$  and 76 inches.

With two models to choose from you can select, according to the size of your grove or orchard, the right size of tractor for your needs. That is important, for when a tractor is too small there is always a tendency to overload it—and wear it out prematurely.

Or the underpowered owner may work his tractor night and day and still never finish up on time—with consequent crop losses from inadequate preparation and cultivation. On the other hand, when a tractor is too large the owner is paying for power he doesn't need.

From every standpoint—time, money, operating comfort, and peace of mind—it pays to pick the right size of tractor for your individual requirements. You can do that when you have a choice—as you have when you buy McCormick-Deering.
